DETAILED ACTION

Election/Restrictions

The election/restriction requirement remains for reasons of record.

Any rejection found in the previous Office Action and not repeated herein has been withdrawn.

The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claims 14, 15 and 31 are under examination.

Claim Rejections - 35 USC § 102

Claim 14 remains rejected under 35 U.S.C. 102(b) as anticipated by El-Khalaty et al. (Applicants' IDS NPL Reference 4*).

El-Khalaty teaches an oil fraction obtained from *Oreodoxa regia* (royal palm) (which is synonymous with *Roystonea regia*) seeds (which reads on fruit, since the royal palm seed contains the fruit) comprising caprylic acid in an amount of 0.4%, capric acid in an amount of 0.4%, lauric acid in an amount of 11.1%, myristic acid in an amount of 5.5%, palmitic acid in an amount of 22.2%, palmitoleic acid in an amount of 9.8%, stearic acid in an amount of 3.0%, oleic acid in amount of 35.3%, linoleic acid in an amount of 17.3% and linolenic acid in amount of 3.5% (See table IV, page 273), which

read on the ranges of each fatty acid component of Applicants' pharmaceutical composition in claim 15. El-Khalaty further teaches that the oil is obtained through a process of first crushing the seed, then defatting the seed followed by subjecting the resulting seed meal to acidic and alkaline hydrolysis (See page 270).

Although El-Khalary does not expressly teach that the oil fraction is a pharmaceutical, the claimed functional properties are inherent to the preparation taught by El-Khalary because El-Khalary expressly teaches the same composition taught by Applicants based upon the fatty acid profile provided by El-Khalary and the method taught by El-Khalary of obtaining the fatty acid profile from the seeds of royal palm. Thus, a pharmaceutical composition is inherent to the oil fraction composition taught by El-Khalary.

Therefore, the reference anticipates the claimed subject matter.

Claims 14, 15 and 31 are rejected under 35 U.S.C. 102(b) as being anticipated by Rabarisoa et al. (X, Translation provided herein).

Rabarisoa teaches an extract of Oreodoxa regia (which is synonymous with Roystonea regia) fruit (See pages 5 and 6, Extract number 15) with the same fatty acid profile claimed by Applicant (see Table III, number 15). Rabarisoa further teaches that the triglycerides were transformed into methyl esters using methanol (which reads on ester hydrolysis) (See page 3).

Although Rabarisoa does not expressly teach that the oil fraction is a pharmaceutical or that the fruit is expressly green or mature, the claimed functional

properties are inherent to the preparation taught by Rabarisoa because Rabarisoa expressly teaches the same composition taught by Applicants based upon the fatty acid profile provided by Rabarisoa and the method taught by Rabarisoa of obtaining the fatty acid profile from the fruit of royal palm. Thus, a pharmaceutical composition is inherent to the oil fraction composition taught by Rabarisoa.

Therefore, the reference anticipates the claimed subject matter.

Response to Arguments

Applicants' arguments concerning the 35 U.S.C. § 102(b) under El-Khalaty rejection above have been thoroughly considered but are not deemed persuasive of error in the rejection.

Applicants argue that El-Khalaty et al. is directed to an extraction from the seeds only, which seed oil is intended to be used in a food product and that the present invention is directed to the whole fruit. Applicants further argue that the profile of fatty acids taught by El-Khalaty is different than that claimed by Applicants.

However, this is not found persuasive because according to "Everyday mysteries: Fun Science Facts from the Library of Congress" (Reference V*), botanically speaking, a coconut is a fibrous one-seeded droupe, also known as a dry drupe, but that when using loose definitions, the coconut can be a fruit, a nut and a seed. "The Free Dictionary: palm" (Reference W) teaches that the seed size of the palm varies, as does the trunk height and diameter and the leaf length and that the fruits of palms, covered with a tough fleshy, fibrous, or leathery outer layer, usually contain a large

Application/Control Number: 10/549,740

Art Unit: 1655

Page 5

amount of endosperm in the seed (stored food) (please note that "Everyday mysteries: Fun Science Facts from the Library of Congress" teaches Some scientists like to refer to the coconut as a water dispersal fruit and seed and that that in addition to the "baby" plant in the seed, there is the food to kick off its life called the endosperm. The endosperm is what makes up most of the seed and, in the coconut's case, is the yummy white stuff we eat, which reads on fruit). "The Free Dictionary: palm oil" teaches that palm oil is the fat pressed from the fibrous flesh of the fruit of many palms. Therefore, it is understood in the art that "seed" can be used interchangeably to mean the fruit of the palm. El-Khalaty also uses this term loosely throughout the introduction, for example El-Khalaty teaches that "the characteristics and fatty acid composition of the *Oreodexa* regia (royal palm) oil from a lot of nuts from Cuba were studied by Stillman et al, and the constants of the oil were fat content (of the kernel)...the fatty acid composition of the oil was..." which demonstrates a difference between the seed as a whole (which contains the fruity pulp of the royal palm) and the kernel. El-Khalaty further teaches that seeds and kernels were investigated in the extraction of oil (See page 270). Finally, Stillman (Reference U*, prior art of record) teaches that the nut of the Cuban palm contains 25% oil and that upon further examination, the ripe fruit of the Cuban palm contains the same oil as that obtained from the kernel of the Cuban palm (again, demonstrating that "seed" contains fruit) and describes saponifying the oil and fractioning the oil to obtain a fatty acid profile. Therefore, it would be expected that at the very least the fatty acid profile of the fruit and of the seed (if there is indeed a difference) would be the same or similar between the oil obtained from the kernel and the fruit and the profile of the whole of the

seed would be expected to be consistent with the profile of oil obtained from the fruit and the profile of the oil obtained from the kernel. Therefore, El-Khalaty reads at least on a mixture of primary fatty acids with 8 to 28 carbon atoms obtained from ripe fruit of Roystonea regia (synonymous with Cuban palm and Cuban palmiche), and at the very least anticipates the subject matter of claim 14, which does not recite exact amounts of each fatty acid and does not require that all of the fatty acids in the claim be present in the composition. Further, the method of obtaining the extract from El-Khalaty appears to be identical to the process, as claimed, by which Applicants have obtained their extract of the Cuban palm fruit and would be expected to contain a similar profile. Optimizing one particular fatty acid would have been obvious to one of ordinary skill in the art (as set forth above and in the previous Office Action).

As currently drafted, the claims remain rejected for the reasons of record and for the reasons set forth above.

Conclusion

No claims are allowed.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Amy L. Clark whose telephone number is (571)272-1310. The examiner can normally be reached on Monday to Friday between 8:30am - 5pm.
